

STUDY OF DANTASAMPAT LAKSHANE WITH REFERENCE TO PRAKRUTI**Chaudhari Rupali¹, SatheKalpana Dilip²**¹M.D.Kriya Sharir, Ph.D Scholar MUHS Nasik, Reader Kriyashrir Department AyurvedMaha-vidyalaya, Pusad, Dist. Yawatmal, Maharashtra, India²M.D KriyaSharir Ayurveda H.O.D, KriyaSharir Department, Sumatibai Shah Ayurveda Mahavidyalaya, Malwadi Hadapsar, pune, Maharashtra, India**ABSTRACT**

Prakruti is a basic concept of *Ayurveda*. This concept of understanding human being is important for the maintenance of health and prevention of disease. *Vata*, *Pitta*, *Kapha* are the three basic *Doshas*. Dominating dosha determines the *Prakruti*. Description of *Dantaswarup* in *Vatal-prakruti* is done by Acharya Charaka only. For convenience of study the charecteristics of *prakruti* can be studied as *Rachanausarini*, *Kriyanusarini*, *Manogunanusarini*. *Dantas* are structurally located in oral cavity. *Acharya Kashyap* states four types of *Dantasas Samudga*, *Samvruta*, *Vivru-taand Dantasampat*. These can be studied under concept of *Prakruti*. Therefore persons of different *prakrutis* were observed in Jalgaon District of Maharashtra. 30 Male and Female aged 30 to 45 years were observed. Volunteers having pregnancy, menopause, and chronic hormonal diseases like Diabetes mellitus. hypo/ hyperthyroidism, parathyroidism, boned eformities like osteoarthritis malignancy were excluded. *Prakrutiparikshan* chart is determined. *Dantasampat* symptoms were verified according to *Trividh Pariksha*. Opinion of dentist was taken. *Pittakaphajprakruti* persons have *dantasampatlakshane* as *Purnata* 88%, *Samata* 88%, *Shuklata* 75%, *Snigdhattha* 63%, *Sthirmula* 88%. In *Vatakphaja Prakruti* persons have *Dantasampat Lakshaneas* *Purnata* 30%, *Samata* 30%, *Shuklata* 70%, *Snigdhattha* 70%, *Sthirmula* 30% and in *Vatapittaja Prakruti* persons have *Purnata* 50%, *Samata* 33%, *Shuklata* 83%, *Snigdhattha* 75%, *Sthirmula* 42%. Thus correlation is made between *Prakruti* and *Dantasampat Lakshne*. Conclusion-Symptoms of *dantasampat* examined by in *trividhpariksha* with the help of modern technology can be co-related in different *Prakrutis*. In this *Pittakaphaj Prakruti* volunteers have *dantasampat* symptoms (Ideal structure).

Keywords: *Prakruti*, *Dantsampat*.**INTRODUCTION**

Ayurveda is an ancient science related to our life. *Prakruti* (Biological constitution of human body) is a basic concept of *Ayurveda*. Maintenance of health, prevention of disease depends on this fundamental concept of understanding human being . 1

The constitution of man (*Prakruti*) is basically determined by the genetic variation of different humors (*Dosha*) in the body within physiological limits. *Vata*, *Pitta*, *Kapha* is the three basic *Doshas*. Dominating *Dosha* determines the *Prakruti* singly or in combination (seven types) and depending

upon the relative predominance of the humors present in the Sukra (sperm), Asrik (ovum) at the time of their union (genetically inherited).² Also the *Bhojyadrayas* (consumed food), *Chesta* (activities) done by the *Garbhini* (pregnant woman) *Garbhashyasthiti* (condition of uterus) and *Rutu* (season) affects *Prakruti* produced.³

In *Kriyasharir* (Ayurvedic physiology) for convenience of study, the characteristics of *prakruti* can be studied as *Rachananusarini*, *Kriyanuarini*, *Manogunanusarini* and thus the symptoms in are grouped in three categories. *Dantaparikshan* comes under *rachanasarini* characteristic of *prakruti*. *Acharya Kashyapa* has given a detail information regarding *Danta* in *Dantajamikadhyaya* which states that among the thirty two teeth, eight are *Sakrujjata* while the remaining are *Dwijj*.⁷ He described four types of *Dantas* as *Samudga*, *Samvruta*, *Vivruta* and *Dantasampata*.⁴ These can be studied under concept of *Prakruti* (anatomical, physiological and psychological)

AIM:- To study Dantasampatlakshane with reference to prakruti.

OBJECTIVE:-To develop *Dantasampat* examination criteria.

REVIEW OF LITERATURE:-

Acharya Charak and *Sushruta* have described *danta* as a type of *Asthidhatu* (bone) On the other hand *Acharya Sharan-gadhara* (Cha .sha.7/6, Su, sha, 5/20) has described *Dantaas Asthiupdhata* (bi-product).⁵ *Prakruti* related description is very less in *Ayurveda*. In *Ayurveda*, terminologies regarding *prakrutadanta* are given in description of *prakruti*. *Danta* in *Vataprakruti* is rough in attribute. They are small in size, and may be one above another *Pittaprakruti*-- persons have white colour teeth. (Ref-Ha. part-1/5,17,18)⁶ *Dantasam-*

patlakshane (symptoms) are described in *Kashaysamhita*.

Dantasampatlakshane(symptoms of ideal denture)

<i>Poornata</i>	-Total in number
<i>Samata</i>	- Equal in size.
<i>Ghanata</i>	-Thickness
<i>Udaronnata</i>	- Slightly forwarded
<i>Shuklata</i>	-White
<i>Snigdhata</i>	-Lusterous
<i>Slkshanata</i>	- Smooth surface
<i>Dantabandhansamata</i>	- Tight gums
<i>Bruhat-sthirmula</i>	- Big strong roots

Dantaparikshan can be done by *Darshan*, *Sparshan*, *Prashna pariksha* i.e. according to *Ayurveda* and with the help of modern dental examination.(Physical examination and interview) Co-relation can be made between *Prakruti* and *Dantasampat lakshane*.

MATERIALANDMETHODS:-

A complete literature review related to subject present in *Ayurvedic Samhitas*, Various Books and Articles Written by and relevant modern literature have been taken. Persons of different *Prakrutis* were observed with *Dantasampat* symptoms by *Trividha Pariksha* and their photographs were taken. *Prakruti* is determined according to *Prakruti Parikshan* chart.

Study site - Jalgaon Dist. - Maharashtra

Sample size- 30

Inclusion - Criteria

Sex- Male and Female

Age - 30-45 years. Community-

Maharashtrian **Exclusion Criteria:-**

1) Pregnancy, Menopause, Chronic Hormonal diseases, like Diabetes Mellitus, hypo/hyperthyroidism, parathyroidism, bone deformities like osteoarthritis, malignancy.

Study Evaluation:-

1) **Clinical assessment has been done**

according to Dantasampat lakshane (symptoms of ideal denture).

2) Observation has been done by Darshan, Sparshan and Prashna Pariksha (Trividh Pariksha).

3) Prakrutiparikshan has been done according to chart.

1. *Poornata* -Total in number
2. *Samata* -Equal in size. Observed by maxillary and mandibular casts
3. *Ghanata* -Thickness by vernier caliper & study Models

4. *Udaronnata* -Photographs, dental shade guide

5. *Shuklata* -Dental shade guide

6. *Snigdhata* -By blotting paper

7. *Dantabandhansamata*- By palpating gum and watching colour of gum.

8. *Brhat-sthirmula*-(Strong root) Checking with the help of mirror and probe.

OBSERVATION:-

Observation based on correlative symptoms of *Dantasampat* and *Prakruti*.

Table No.1

<i>Pittkaphaj Prakruti</i>				
Sr. No.	Variable	Groups	Frequency	%
1	Age	31-35	4	50

DISCUSSION

From the above observations, examination of *Dantsampat* symptoms can be done by *Trividhpariksha* (physical examination and interview) and modern techniques with the help of Cast, probe, mirror, torch, dental shade guide as-

In the above study combination of *Prakruti* in volunteers were formed as *Pittakaphaj* 26.66%, *Vatakaphaj* 33.33% and *Vatapittaj* 40%

CONCLUSION

From the above observations and discussion it is concluded that symptoms of *Dantasampat* examined by *TrividhPariksha*

with the help of modern technology can be co-relate in different *Prakruti*s. In this *Pittakaphaj Prakruti* volunteers have *Dantasampat* symptoms (ideal denture).
