APPLICATION OF ETHNOMEDICINE IN DENTISTRY – A REVIEW

Harsh Mahajan¹, Sunil Mishra ², Hazari Puja³, Shivangi Mahajan⁴
¹,² Reader, ³Sr. Lecturer, ⁴Private Practitioner;
Department of Maxillofacial Prosthodontics and Implantology, Peoples Dental Academy,
Bhopal, Madhya Pradesh, India

ABSTRACT

Background: Ethnomedicine is the study of traditional medicines. It is practiced by many traditional groups and has related written sources and also the knowledge and practices have been verbally transmitted over the centuries by various ethnic groups and mainly by indigenous peoples. Purpose: Despite vast progress in the field of medical science, nowadays research in drugs derived from plants are gaining popularity due to various side effects and complications of chemical and synthetic drugs. Incidence of multidrug resistant bacteria also sparks scientists on the research for plant based antimicrobial agents. Plants have been shown to contain various phyto-chemicals which have curative, sedative and defensive properties. This article will review various medicinal plants and products along with their therapeutic applications used in dentistry. Material and Methods: An electronic search was performed using Pubmed, Medline and Ebscohost database. The search is focused on ethnomedicine in dentistry. Articles published in English were only included in the review. At first the titles and abstracts related to the topic were searched and literature that fulfilled the required inclusion criteria was selected for review. Result: An extensive search of literature on Ebscohost and Pubmed database had identified 100 articles out of which 52 relevant articles of ethnomedicine in dentistry were selected and included in this review article. Conclusion: Plants have been shown to contain various phyto-chemicals which have curative, sedative and defensive properties in dentistry. More clinical studies and more research on the safety, related side effects and efficacy of herbal medicines are still required.

Key words: Propolis, Ethnomedicine, Aloe vera, Herbs

INTRODUCTION

In major parts of the world plants are used as medicine. In rural areas medicinal plants are still the major source of primary health care. For the primary health related needs 80% population depends on herbal medicine as reported by the World Health Organization (WHO).¹ In the developed countries, 25% of the drugs are based on herbs and their derivatives.² Due to various side effects of the conventional drug therapies and incidence of multi drug resistant bacteria the research of plant based antimicrobial agents are gaining a wide popularity nowadays.

Herb is the plant in which woody tissue is deficient. In oral diseases herbs are very efficient mode of treatment for different disease. Herbal preparations are obtained from different parts of the plant such as flowers, seeds, leaves etc. This review article will summarize various articles on medicinal herbs which are useful in dentistry as a substitute to allopathic medicines. Review of various studies or articles on application of medicinal plants in dentistry were tabulated in Table 1. An extensive search of literature on Ebscohost and Pubmed database had identified 100 articles out of which 52 relevant articles of ethnomedicine in dentistry were selected and included in this review article.

Objectives

- To evaluate various medicinal herbs used in dentistry
- To analyze the efficacy of various medicinal herbs on the periodontium and other oral conditions

Inclusion Criteria:
1. Research articles original in nature.
2. Articles related to herbs on which Review was done.
3. In vivo and In vitro studies

Exclusion Criteria:
1. Articles before year 2000.
2. Articles whose abstracts are only readable.

Role of Herbs in Dentistry

In the last few years in the field of dentistry there has been a marked increase in interest in the drugs derived from the plants. Literature also shows that there are many plant species which have the potential to be used as an alternative to conventional drug therapy. There are many disadvantages of the antimicrobial and pulp therapeutic agents which are used nowadays like immune suppression, hypersensitivity, allergic reactions, and resistance of many microorganisms to these drugs. Therefore there is a vast scope of plant species which has therapeutic properties. Therapeutics products which are based on Plants has less side effects and they are non-toxic, positively bio-degradable and less expensive. Aloe Vera (Emblica officinalis)

Many researchers have shown that aloe vera is useful in treating apthous ulcer, lichen planus and alveolar osteitis. It also has inhibitory effect on Streptococcus pyogens & Enterococcs faecalis. It is also has anti-inflammatory property which is useful in treating plaque induced gingivitis. For the cure and prevention of caries and disease related to gingiva and periodontium it can be used as antiseptic. Many research on aloevera has shown positive effect in treatment of periodontal pockets as they can be used locally.

Neem (Azadiracta indica)

Many researchers have shown that neem has anti-microbial activity against Enterococcus faecalis, Streptococcus aureus and Streptococcus mutans. It has a potential to be used as a potent intra-canal medicament. Neem extract has good antioxidant property. They are useful in treatment of liver diseases and many cancerous lesions and conditions.

Triphala

‘Triphala’ is a well-known powdered preparation. It contains Terminalia belerica, Terminalia chebula, Emblica officinalis. Studies have shown that it has anticaries, antioxidant, anticollegenase, and antimicrobial activities. It can be used as a root canal irrigant and mouth wash.

Green Tea (Camellia sinensis)
Various studies had done on green tea and it was found that polyphenols in Green tea have good antioxidant, anti microbial, anticiariogenic and anti-inflammatory property. It has an effective probiotic property.\cite{39,40} It has lot of uses in dentistry as it is an effective anti –plaque and anticiariogenic agent due to the presence of fluoride.\cite{32,40} Matsumoto et al. studying the antibacterial and antifungal property of green tea and found that it inhibit the growth of several bacteria and fungi.\cite{41} Sakanaka et al. studied the growth of Streptococcus mutans and observed that green tea inhibits their growth.\cite{42} These all shows that green tea can be valuable asset in dentistry.

**Tulsi (Ocimum sanctum)**

Tulsi has antimicrobial property. Study shows that microorganisms such as Enterococcus-faecalis, Streptococcus aureus and Streptococcus mutans are sensitive to it.\cite{28} Due to presence of anti-oxidant in tulsi, it has been shown to be effective in treatment of oral sub-mucous fibrosis and reduces periodontal tissue breakdown.\cite{18} In oral cure tulsi is widely used, as it kills harmful microorganisms in oral cavity. In the treatment of oral ulcers and oral cancer it efficacy is well known.\cite{48}

**Pomegranate (Punica granatum)**
Pomegranate (punica granatum) has been shown to be helpful in treating periodontal diseases.\cite{24} Sara tavassoli-Hojjati etal shows that pomegranate juice can be suitable transport media for avulsed tooth.\cite{29}

**Curry leaf tree ( Murraya koenigii spreng)**

Curry leaves have antimicrobial property against Streptococcus mutans, and Streptococcus sanguinis. It contains sesquiterpenes and monoterpenes oils. It has anti cariogenic property due to chlorophyll present in it. It is used in treatment of dental caries and periodontal diseases.\cite{49}

**Garlic (Allium Sativum)**

Garlic extract significantly inhibits growth of S.mutant and therefore can be used as an effective treatment option in the control of dental caries. Allicin present in garlic destroys cell wall and cell membrane of root canal bacteria and thus can be used as an irrigant in root canal treatment.\cite{50}

**Other Herbs**

Herbal agents like propolis, A. vera have healing potential thus making them good pulp therapeutic agents.\cite{43,44} In other study it has also been shown that propolis had an effective antifungal action on C. albicans (which is the most common fungus seen in root canals) similar to that of NaOCl.\cite{45} Studies have found that S. mutans are highly sensitive to Cinnamon oil and hence it can be used in toothpaste and mouth wash as antiseptic agent.\cite{51} Eucalyptus has antimicrobial activity against S.aureus. It has been reported that chewing gum containing eucalyptus extracts improves gingival health, decreases bleeding during probing and reduces periodontal diseases.\cite{52}

**CONCLUSION**

Use of herbal medicines in dentistry are day by day increasing and becoming popular among dental practitioners. Herbal medicines are like double edge sword, so a thorough knowledge is very important about its use in dentistry to avoid its misuse. Today herbal medicine should be added in dental curriculum so that dental students and practitioners could aware about the uses and ill effects of it. Further research is on herbal medicines and their role in dentistry in coming future so that it can be used safely in treatment of many dental diseases.
