ABSTRACT

Sensory neural hearing loss occurs when there is a problem in the sensory apparatus - cochlea (sensory) or in the pathways of conduction of nerve impulses to the brain. SNHL can be Peripheral and Central (auditory pathway or cortex). It can be congenital or acquired. Congenital: present at birth, due to anomalies of inner ear or due to pre or perinatal factors. In present study we have discussed a case of a 12-year-old male child who came to OPD with complains of Sensory neural hearing loss since childhood. Audiometry report showed Right ear - moderate to profound mixed hearing loss Left ear - moderate to severe sensory neural hearing loss. First Ayurveda treatment of Sensory neural hearing loss with three sittings of Marsha Nasya from Anu Taila, 3 sittings of Karnapurana from Bilwadi Taila and Sarivadi Vati with the dose of 250mg thrice a day with luke warm water or milk for 1 month were given in a month and same procedure followed for 6 months. After that his hearing improved showing audiometric findings of Moderate hearing in both ear. After six months repeat Audiometry was done. Patient also felt better hearing in both ears. Decreased hearing due to Sensory neural hearing loss is result of Damage of hair cells, which can be managed with the help of Ayurveda treatment- Marsha Nasya, Karnapurana with Rasayana treatment. Hearing loss to school going children is a very serious problem affecting their education, skills and social relationship with others. With this study we can cure this type of deafness without any surgical intervention and help them to live their life in a better way.

Key words: Badhirya, Rasayana, Nasya, Karnapurana, Sensory neural hearing loss.

INTRODUCTION

Hearing ability is of utmost importance for the development of speech and language skills in a child. In the earlier times it was very difficult to detect hearing loss in children. However, with advanced medical science and technology hearing loss in children can be detected at an early stage. Hearing loss is a partial or complete inability to receive and interpret sound stimuli in one or both ears. Hearing loss is categorized in to Conductive, Sensorineural and Mixed hearing loss on the basis of pathogenesis. Childhood hearing loss can be a debilitating condition that affects a significant degree of physical, mental and social health. Sensory neural hearing loss is most common hearing loss in children which accounts for 85 to 90% of childhood
hearing loss in India. Increasingly more attention is being focused on mild or slight hearing impairment>20dB HL including unilateral or bilateral loss that may affect 10 to 15% of school-aged children with deleterious effects on school performance and social emotional development.

CAUSES:
Congenital hearing loss is a hearing loss that is present at the birth. This loss can be because of genetic or non-genetic reasons. Some of the non-genetic causes can be: Alcohol or smoking in pregnancy, Diabetes in pregnancy, Infection in pregnancy (mumps, syphilis, tuberculosis meningitis, enteric fever, labyrinthitis, Herpes simplex, toxoplasmosis etc.), Brain or nervous disorder in the baby, premature birth, Low birth weight and Birth traumas or injuries. The possibility of non-genetic factors causing hearing loss in babies in only 25%, however the possibility of babies born with hearing disability at birth due to genetic factors is up to 50%. Some of the genetic causes can be following: Autosomal recessive hearing loss may occur when the child gets the recessive or abnormal gene from the parents. Autosomal recessive hearing loss constitutes 70% of all genetic hearing loss cases. Autosomal dominant hearing loss may occur when the defective or abnormal gene from one of the parents with hearing disability may get passed on to the child. This kind of hearing loss occurs in 15% of the genetic hearing loss cases. Though the above mentioned genetic and non-genetic causes may result in congenital hearing loss but the cause of some of the cases of hearing loss at birth may be difficult to establish.

EXAMINATIONS:
Following are some of the test that may be recommended for the babies and children to diagnose hearing loss:
- Auditory brainstem response
- Central auditory evoked potential
- Otoacoustic emissions
- Middle ear muscle reflex
- Tympanometry
- B.E.R.A
- Audiometry

AYURVEDIC MANAGEMENT
If any symptoms or signs of hearing loss in a child are established, it is suggested to seek immediate medical help to avoid any further complications and get timely medical treatment. If the child is facing deafness or total hearing loss, it will be a good idea to make the child learn sign language. You may enroll the child in special educational institutes or school that specializes in imported education to children with hearing disabilities. Children with Sensorineural hearing loss in both ears need to be identified and fit with hearing aids as soon as possible. It is important that the degree of hearing loss in each ear be diagnosed as accurately as possible.

CASE DESCRIPTION:
Date: 12/10/2018
Age: 12 years
Sex: male
Occupation: Student
Place: Jamnagar

Chief complains
Hearing loss bilateral since childhood.
Can’t hear from 1 room to another room.
Speech discrimination poor.

History of Present illness:
A 12 years old male child came in ENT OPD of Shalakya Tantra department in our hospital with the complaints of decrease hearing in both ears from childhood.

History of Past illness:
No any past history found.

Family History:
No any family history found.

Clinical Findings:
Ear Examination:
- Otoscopy
  1) EAC: B/L Clear
  2) TM: B/L intact retracted
- Rinne’s test: Air conduction > Bone conduction Bilateral
- Weber’s test: Lateralized to right ear.
Audiometry: (12/10/2018)
Right ear - moderate to profound mixed hearing loss
Left ear - moderate to severe sensory neural hearing loss

General Examination:
- Weight: 42 Kg
- Height: 154cm
- Pulse rate: 72/min
- BP: 110/82 mmHg

Personal History:
- Diet: Vegetarian
- Appetite: Good
- Bowel: Regular
- Micturition: Normal
- Sleep: Normal

Line of Management:
The patient was given Ayurveda treatment with holistic approach i.e. Shodhana and Shamana treatment with Pathya Apathya. Treatment prescribed from was as following:

Table 1:

</tbody>
</table>

RESULTS
After 06 month of treatment patient got excellent result in subjective criteria like hearing and speech also. Now he was able to hear from one room to another room. He can also able to pronounce words better from previous. Repeat Audiometry was done (12/4/2019), which showed moderate sensory neural hearing loss in both ear.

IAMJ: Volume 7, Issue 5, May - 2019 (www.iamj.in)
DISCUSSION

Badhirya (SNHL) is one of the most common ENT disorder and it is one of the challenging problems of all ENT surgeon’s, the disease look simples but it doesn’t bring satisfactory relief to the patients after repeated visiting the ENT clinic. Thus, the treatment adopted for Badhirya in modern system of medicine has not been satisfactory. Surgical intervention (cochlea implant) is rare in these cases and performed only when presented with complications.⁶ The “Vata Vyadhi Chikitsa” Siddhant can be implemented as a management of Badhirya⁷. Besides these, Ayurveda also offers different kind of treatment modality in the management of Badhirya. E.g. Ghritapana, Rasayanasevana, Nasya, Snehana, Swedana, Snehavirechana, Sirobasti, Karnapurana, Jalaukavacharana etc.⁸ but, Karnapurana and Nasya is most prescribed procedure in the management of Badhirya.

As mentioned earlier that the signs and symptoms of Hearing loss can be correlated with Badhirya in Ayurveda. Badhirya is due to vitiation of Vata and Kapha Dosha.⁹ Anu Taila Nasya¹⁰ scratches out the Kapha Dosha from Shira and improves the function of indriyas (Karnaindriya) thereby clearing the Srotorodha. Anu Taila was planned which pacifies the aggravated Vata Dosha in head and helps to normalize the function of central nervous system by nourishing the nervous system And balancing the circulation of blood in the sense organs including ear also.
As Shringataka marma in Shira is the junction of all sense organs like eye, ear, nose and any medicine applied over this area targets the vitiated doshas related to all sense organs and helps in nourishment of nerves connecting to these areas. Karnapurana11 is one of the basic treatments mentioned in Ayurvedic literature for all Karnarogas. Karnapurana with Bilwadi Taila has the Vatashamaka property. Sarivadi Vati12 removes Srotorodha and does Vatanulomana. It is the best Rasayana Dravya for Shravnendriya Vikara. During six months of treatment period and follow up we have not encountered any ADR related to oral treatment Nasya, and Karnapurana in the patient. Patient and his family were very happy that his hearing was improved and they were suggested for surgery from allopathic medicine before 3 years. Patient was prescribed routine and classical Ayurveda medicine and was not treated with any intentions of future publication we have not taken any accent of patient or prior informed consent from patient.

CONCLUSION

Congenital hearing loss is a hearing loss that is present at the birth. Childhood hearing loss can be a debilitating condition that affects a significant degree of physical, mental and social health. Anu Taila Nasya, Bilwadi Taila Karnapurana and Sarivadi Vati orally gives excellent result in congenital sensory neural hearing loss thus Ayurveda has a variety of medicines and procedures to treat Badhirya (sensory neural hearing loss). This case study indicates effectiveness of Ayurveda in management of Badhirya.
